2011-2012
IB MYP YEAR 4

SUMMATIVE ASSESSMENT

Year 9 Mathematics (Extended)

Name: Jasmine Tuan [9 Hope] Ms. Li

Date of task: **8th June, 2012** Time allowed: **1.5 hours (11:40 -13:10)**

Teacher: **Ms Li / Mr Millard / Mr So**

Student's **Performance** in Different **Criteria**			
A	3	**C**	4

Instructions

- Read the instructions for all questions carefully.
- All work must be hand written.
- All work, steps and proper units must be shown.
- A non-electronic dictionary is allowed.
- Use of calculator is allowed.

Advice:

- Read the criteria descriptors and task-specific rubrics carefully before you start your work. This will give you a clear understanding of what is required and what a high quality piece of work for this task must include. This way you give yourself the best chance of achieving the highest levels in this task.

- This assessment task will be assessed on Criterion **A** & **C**.
  - For Criteria **A**, the questions are all assigned with levels;
  - Criterion **C** will be assessed as an overall impression on the presentation of work in this assessment.

ASSESSMENT CRITERIA

Criterion A: KNOWLEDGE AND UNDERSTANDING

Achievement level	Task Specific Rubric	IBO Published Descriptor
0	The student does not reach a standard described by any of the descriptors given below.	The student does not reach a standard described by any of the descriptors given below.
1–2 **Simple**	The student can solve **some simple** problems.	The student **generally** makes appropriate deductions when solving **simple** problems in **familiar** contexts.
3–4 **Complex**	The student can solve **most simple** and **some more complex** problems.	The student **generally** makes appropriate deductions when solving **more complex** problems in **familiar** contexts.
5–6 **Challenging**	The student can solve **some challenging** problem along with **all** different types of problems.	The student **generally** makes **appropriate** deductions when solving **challenging** problems in a **variety** of **familiar** contexts.
7–8 **Unfamiliar**	The student can solve **most** challenging and **most unfamiliar** problems along with **all** different types of problems.	The student **consistently** makes **appropriate** deductions when solving **challenging** problems in a **variety** of contexts including **unfamiliar** situations.

Criterion C: COMMUNICATION IN MATHEMATICS

Achievement level	Task Specific Rubric	IBO Published Descriptor
0	The student does not reach a standard described by any of the descriptors given below.	The student does not reach a standard described by any of the descriptors given below.
1–2	The student should be able to explain **some problems** step by step. The lines of reasoning are **difficult to follow**.	The student shows **basic** use of mathematical language **and/or** forms of mathematical representation. The lines of reasoning are **difficult to follow**.
3–4	The student should be able to explain **most problems** step by step. The lines of reasoning are **clear** though **not always logical** or **complete**.	The student shows **sufficient** use of mathematical language **and** forms of mathematical representation. The lines of reasoning are **clear** though not always **logical** or **complete**. The student moves between different forms of representation **with some success**.
5–6	The student should be able to explain **most problems** step by step. The lines of reasoning are **concise**, **logical** and **complete**. The student use **correct unit** in the questions.	The student shows **good** use of mathematical language **and** forms of mathematical representation. The lines of reasoning are **concise**, **logical** and **complete**. The student moves **effectively** between different forms of representation.

Soh cah toa

A. SIMPLE PROBLEMS

Suggested time allocation for Question **1 to 5** is **15 minutes**.

1. Given the points A (–1 , 2) and *B* = (2 , ***k***), find the value(s) of ***k*** such that the **length of line AB is 5 units**.

$5 = \sqrt{[2-(-1)]^2 + (k-2)^2}$

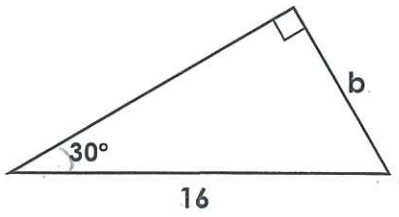
$5 = \sqrt{9 + k^2 + 4}$

$5 = \sqrt{k^2}$

$5 - 3 = k$

$k = -8$

2. In the figure on the right, find the value of **b without using calculator**.



$\sin 30° = \frac{b}{16}$

$\frac{1}{2} \times 16 = b$

$b = 8$

3. Given that the equation of the line **L1** is $y - 2x = 4$, which of the following line(s) is/are **parallel to L1**? Which of the following line(s) has/have **negative y-intercepts**?

L2: $y = -2x + 4$ **L3:** $2y - 4x - 5 = 0$ **L4:** $-3y = 2x + 4$ **L5:** $6x - 9 = 3y$

Explain your answers by showing your calculations.

L1 $-2x + 4 = y$

$y = -2x + 4$

L2 : $y = -2x + 4$

∴ L2, L3, L5 = $-2x$

∴ L2, L3, L5 are parallel with L1

L3 $2y = 4x + 5$

$y = \frac{4}{2}x + \frac{5}{2}$

$y = -2x - \frac{5}{2}$

L4 $y = \frac{2}{3}x + \frac{4}{3}$

L5 $3y = 6x - 9$

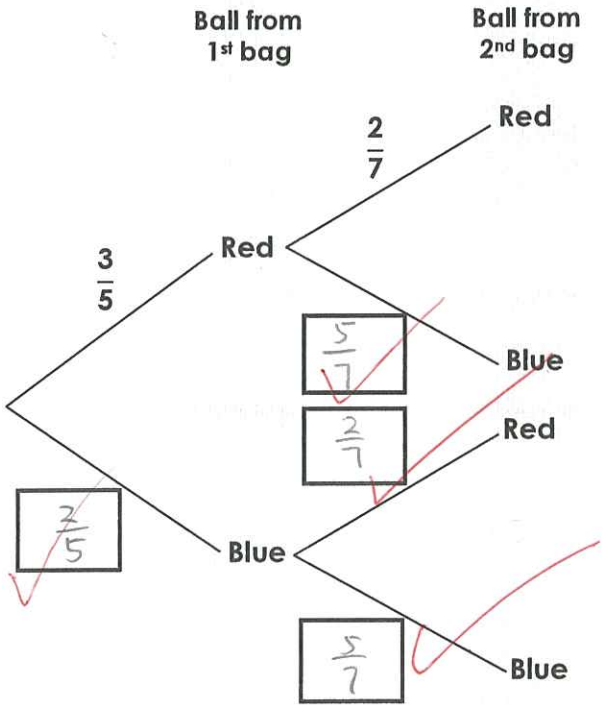
$y = \frac{-6}{3}x + \frac{9}{3}$

$y = -2x + 3$

L3 is the line which have the negative y-intercepts

4. Loren has two bags. The **first** bag contains **3 red** balls and **2 blue** balls. The **second** bag contains **2 red** balls and **5 blue** balls. Loren takes **1 ball** at random from **each bag**.

(a) Complete the probability **tree diagram** by entering the **correct answers into the boxes.**



(b) Find the probability that Loren takes **two red balls.**

$\frac{3}{5} \times \frac{2}{7}$

$= \frac{6}{35}$

P(two red balls) $= \frac{6}{35}$

5. Evaluate the following **without using calculator.**

$$\sin^2 23° + \cos^2 23° - \frac{\sin 45°}{\cos 45°}$$

$\sin^2 23° + \cos^2 23° - \frac{\sin 45°}{\cos 45°}$

$= 1 - \frac{\frac{\sqrt{2}}{2}}{\frac{\sqrt{2}}{2}}$

$= 1 - \frac{\sqrt{2}}{2} \times \frac{2}{\sqrt{2}}$

$= 1 - \frac{\sqrt{2}}{2} \times \frac{2\sqrt{2}}{2}$

$= 1 - \frac{2}{2}$

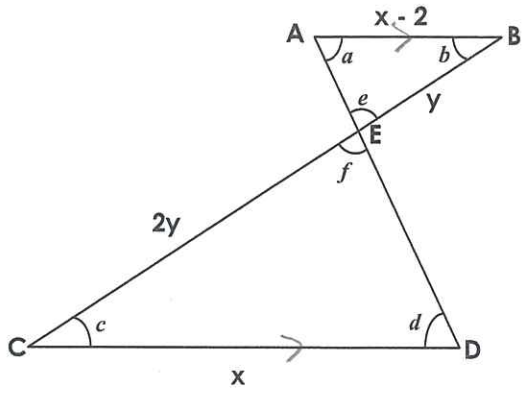
$= 1 - 1$

$= 0$

B. MORE COMPLEX PROBLEMS

Suggested time allocation for Question **6 to 9** is **25 minutes**.

6. In the figure below, the line AB is parallel to the line CD and some dimensions are shown in terms of x or y.



(a) Show that Δ **ABE** and Δ**DCE** are **similar**. State the reason(s) if necessary.

In $\triangle ABE$ and $\triangle DCE$

$\angle ABE = \angle ECD$ (alt $\angle$s AB // CD)

$\angle AEB = \angle CED$ (vert opp. $\angle$s)

$\angle BAE = \angle CDE$ ($\angle$ sum of $\triangle$)

$\therefore \triangle ABE \sim \triangle DCE$ (AAA)

(b) Find the value of **x**.

In $\triangle ABE$ and $\triangle DCE$

$\frac{AB}{DC} = \frac{BE}{CE} = \frac{AE}{DE}$

$\frac{x-2}{x} = \frac{y}{2y} = \frac{AE}{AD}$

Let y be 2

$\frac{x-2}{x} = \frac{2}{2(2)}$

$\frac{x-2}{x} = \frac{2}{4}$

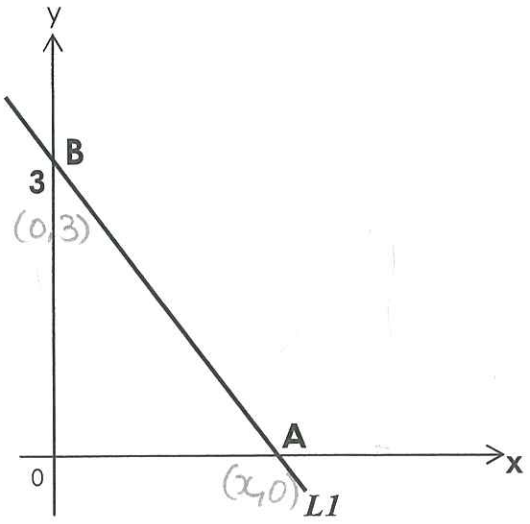
$4x - 8 = 2x$

$4x - 2x = 8$

$2x = 8$

$x = 4$

7. In the graph on the right, a line ***L1*** cuts the x-axis and y-axis at point **A** and **B** respectively. The y-intercept is 3.



(a) If the area of the triangle AOB is 3 square units, find the **equation** of ***L1***. Express your answer in **slope-intercept form**.

Let x be ? why?

$\frac{3-0}{0-2} = -\frac{3}{2}$ ✗

$-\frac{3}{2} = \frac{3-y}{2-x}$

$-6+3x = 6-2y$

$2y+3x-12 = 0$

$2y = -3x+12$

$y = -\frac{3}{2}x + \frac{12}{2}$

$y = -\frac{3}{2}x + 6$

(b) If a line ***L2*** is **perpendicular** to ***L1*** and two lines intersect at point **D(4,-3)**, find the equation of ***L2***. Express your answer in **general form**.

M

$-\frac{3}{2} \times L2 = -1$ ✓

M

$-\frac{3}{2} \times 1 = L2$ ✓

M $L2 = \frac{2}{3}$

$\frac{2}{3} = \frac{y-(-3)}{x-4}$ ✓

$\frac{2}{3} = \frac{y+3}{x-4}$ ✓

$2x-4 = 3y+9$

$2x-3y-13 = 0$

8. In a certain dice game, the player throws **two** typical unbiased **six-faces dice** and receives **$5** if the sum is **7 or 11**, otherwise he or she **pays $2**.

(a) Calculate the probability of obtaining the **sum of 7 or 11** when you **throw the two dice once**.

Dice1 / Dice2	1	2	3	4	5	6
1		3	4	5	6	7
2	3		5	6	7	8
3	4	5		7	8	9
4	5	6	7		9	10
5	6	7	8	9		11
6	7	8	9	10	11	

$P(7 \text{ or } 11) = \frac{1+3}{15}$

$= \frac{4}{15}$

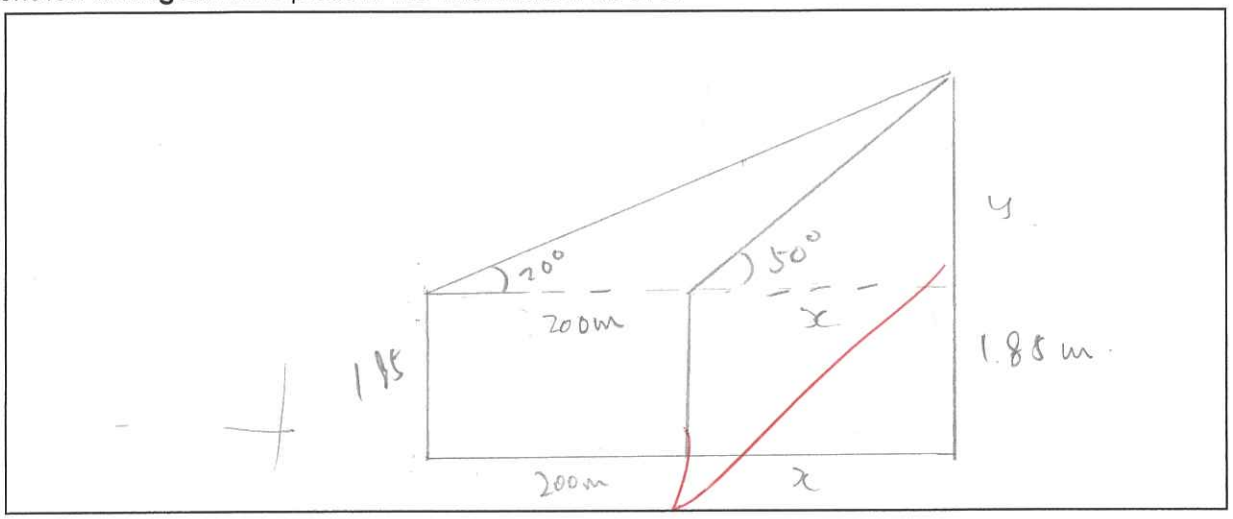
X

(b) If you play the game **18 times**, calculate the **amount of money** you **expect to gain or lose**.

X

9. Mr Bolivar, a volunteer fireman who is 1.85 m tall, is running towards a burning building where there is a fire on the roof. Initially, his angle of elevation to the roof is 20°. He runs for 200 m and now his angle of elevation is 50°. Assume that the ground is horizontal and the building is vertical.

(a) Sketch a **diagram** to represent the information above.



(b) How tall is the building? Correct your answer to the **nearest meter**.

$$\tan 20^\circ = \frac{1.85 + y}{200 + x}$$

Let x be 0

$$\tan 20^\circ = \frac{1.85 + y}{200}$$

$$200 \times \tan 20^\circ = 1.85 + y$$

$$200 \times \tan 20^\circ - 1.85 = y$$

$$y = 70.9 \text{ m}$$

$$70.9 + 1.85 = 72.75 \text{ m}$$

C. CHALLENGING PROBLEM

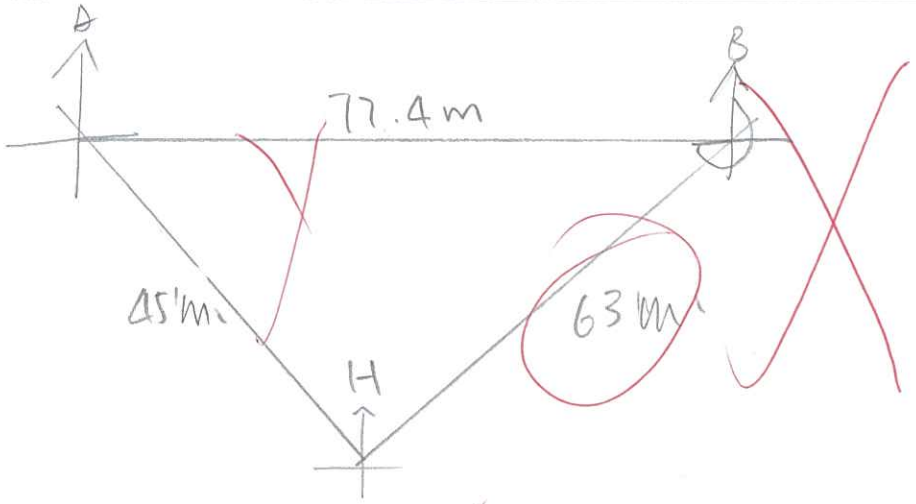
Suggested time allocation for Question **10 and 11** is **30 minutes**.

10. Ship **A** leaves the harbor H on a bearing **150°** with a speed of **40** km/hr. At the same time, Ship **B** leaves harbor H on a bearing **210°** with a speed of **40** km/hr.

(a) **After 12 minutes**, how far did ship A and ship B travel?

$A = \frac{150^\circ}{40} \times 12 = 3 \times 15 = 45$ km $B = \frac{210^\circ}{10} \times 3 = 63$ m

(b) Sketch a **diagram** to represent the information above **12 minutes after the two ships left the harbor.**



(c) Find the **true bearing from Ship A to Ship B** 12 minutes after they left the harbor.

$180^\circ + 90^\circ = 270^\circ$

(d) Find the **distance between the two ships** 12 minutes after they left the harbor. Give your answer to the **nearest meter.**

$AB = \sqrt{45^2 + 63^2}$

$AB = \sqrt{2025 + 3969}$

$= \sqrt{5994}$

$= 77.4$ m

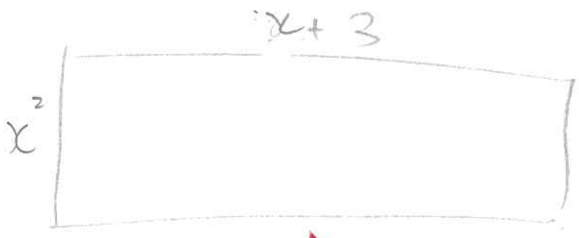
distance between 2 ships after 12 minutes they left the harbor is 77.4 m

11. The properties of a rectangle and a square are given below:

- The length of the rectangle is 3 cm longer than the side of the square.
- The width of the rectangle is double the length of the side of the square.

If the **sum of their areas** is **24 cm²**, find the **dimensions** (that is, its length and width) of the rectangle.

Let side of square



$x^2 + x + 3$

$(x - 1)(x - 2)$

D. Unfamiliar problems (Suggested time allocation for Question **12 and 13** is **30 minutes**.)

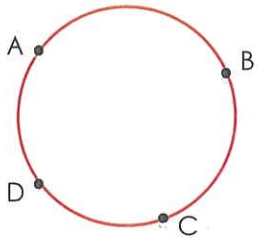
12. At noon, Tom and Pete both park at the same starting point. Tom starts to ride his bike at 8 miles/hr. Two hours later, Pete starts after Tom on a bicycle at 12 miles/hr.

(a) How far will Tom have ridden before he is **overtaken by Pete**?

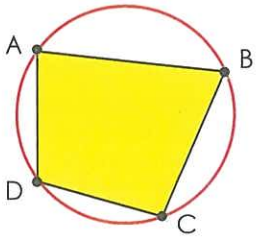
(b) At what time will Tom and Pete be **8 miles** apart?

13. Please read the following information and then do the proof on next page.

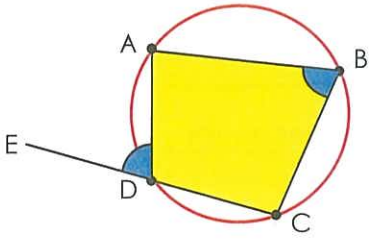
Points lie on the **same circle**, as the diagram below, are said to be **concyclic**. For example, A, B, C and D are **concyclic points**.



If the vertices of a **quadrilateral** lie on a **circle**, as the diagram below, then the quadrilateral is said to be **cyclic**. For example, ABCD is a **cyclic quadrilateral** since the vertices A, B, C and D lie on the circle.

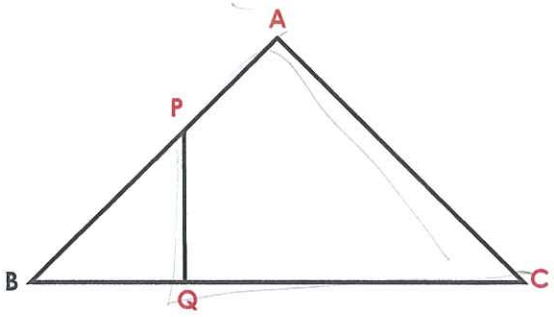


If the side CD is produced (i.e. extended) to E, as the diagram below, then **∠ADE** is called the **exterior angle of the cyclic quadrilateral** ABCD, and **∠ABC** is said to be the **interior opposite angle**.



Theorem: **If ∠ADE = ∠ABC, then A, B, C and D are concyclic. (ext.∠, int. opp.∠)**

In the figure below, **ΔABC** and **ΔBPQ** are **isosceles** triangles such that **AB = AC** and **BQ = PQ**.
Using the provided information about the concyclic points and cyclic quadrilateral, **prove** that **A, P, Q and C are concyclic**.



End of Assessment
